

Ancient Rome

Ancient Rome was one of the most powerful civilisations in history, lasting from the founding of the city in 753 BC to the fall of the Western Roman Empire in 476 AD.

Rome began as a small city-state on the banks of the Tiber River in central Italy. According to tradition, it was founded by the twins Romulus and Remus.

The Republic expanded aggressively through conquest. Rome fought three major wars against the Carthaginians, known as the Punic Wars.

Julius Caesar was a pivotal figure in Rome's transition from Republic to Empire. His military campaigns conquered Gaul and crossed the Rubicon.

At its height under Emperor Trajan in around 117 AD, the Roman Empire stretched from Britain in the northwest to Persia in the east.

Roman engineering achievements were remarkable. They built an extensive road network spanning over 400,000 miles, as well as aqueducts, amphitheatres, and the Colosseum.
